Team Name : Assemblers

Team Leader Name : Sandeep Udeg

Problem Statement : [Professional Track] AI for Rural Innovation & Sustainable Systems

# Project Title: Gram-Setu (Unified Rural Engine)

## Vision

Gram-Setu is a **Unified Rural Ecosystem (URE)** platform designed to bridge the digital divide for India's heartland. Instead of isolated tools, we provide a **Multi-Agent "Operating System"** that manages the three most critical pillars of rural life: **Agricultural Health, Government Welfare Access, & Sustainable Resource Management.**

## Core Solution

Our solution employs a **Supervisor-Worker Architecture** to act as a proactive digital companion for rural citizens:

- **Orchestrator:** A central "Supervisor" agent that manages intent and conversation state, ensuring that data flows seamlessly between domains.
- **Agri-Expert :** Provides instant crop disease diagnosis using multimodal vision grounded in the Plant Village dataset and connects users to real-time Mandi prices.
- **Policy-Navigator :** Simplifies complex government schemes (like PM-Kisan and PKVY) using RAG (Retrieval-Augmented Generation) to provide eligibility hallucination-free advice.
- **Eco-Resource :** Processes soil and weather data to provide precise irrigation and energy schedules, significantly reducing resource waste.

## Technical Architecture

- **Intelligence:** Powered by **Claude 3.5 Sonnet** via Amazon Bedrock for high-fidelity reasoning.
- **Orchestration:** Built using the **Strands Agents SDK** for modular, agentic workflows.
- **Data Strategy:** Uses **Amazon S3** for image and sensor log storage, with **Bedrock Knowledge Bases** for grounding policy advice in verified datasets.
- **Responsible AI:** Integrated with **Bedrock Guardrails** to ensure all advice is safe, culturally sensitive, and **privacy-compliant.**
- **MCP:** It allows orchestrator to securely connect to external data source and act as a standardized **plug and play** interface between Agent and data

## Impact & Scalability

Gram-Setu is built to be voice-first and multilingual, making it accessible to users regardless of their literacy level. By optimizing resource use and providing direct market/subsidy linkages, the platform aims to increase net farmer income by **18–22%** while reducing water consumption by up to **45%**.

## Your solution should be able to explain the following

### How different is it from any of the other existing ideas?

Unlike existing siloed agri-tech solutions, our platform unifies multiple rural services into a single AI-driven ecosystem that delivers integrated, actionable decisions

- Potential for AI-driven unified decision support not just for specific tasks but for overarching strategy
- Holistic integration of data across advisory, environmental, market, and operational layers
- A shift from standalone tools or service networks to intelligent ecosystem insights

### How will it be able to solve the problem?

By integrating fragmented rural data and applying AI-driven decision intelligence, the platform transforms complex agricultural challenges into clear solutions.

- Data Integration from Multiple Sources
- AI-Driven Analysis & Intelligence
- Actionable Recommendations
- Actionable Recommendations
- Trade-off Based Decision Making
- Continuous Learning & Improvement

### USP of the proposed solution

A unified AI decision ecosystem that transforms fragmented rural data into actionable, intelligent decisions

- One Platform, One AI Brain
- Trade-Off Aware Decision Intelligence
- Ecosystem-Scale Impact

# Core Differentiator

Government of India  
Gram-Setu  
URE

## Competitive Positioning: Unified Rural Ecosystem (URE)

Targeting 150 Million Smallholder Farmers in India

### Target Customer Segments

- Smallholder Farmers (1.08 hectares avg.)
- Low-Literacy Users (Voice-First)
- 12+ Indian Regional Languages
- Service-Integrators

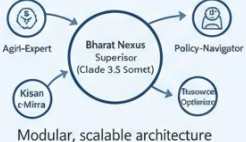

### Market Category

- AI-Powered Agri-Advisory
- Multi-Agent Conversation AI
- Rural Digital Ecosystems

Competitor Type Landscape	Competitive Landscape	URE's Advantage
Direct (Agri-Te-Tech)	E-commerce & siloed AI advisory	🏆 Agentic Orchestration: Specialized, collaborative agents
Direct (Data-as-Service)	E-commerce & siloed AI advisory	🏆 Proactive Intelligence: IOT triggers & realtime alerts
Indirect (Govt. e-Mitra)	Satellite imagery & NDVI analysis	🏆 Contextual Cross-talk: Links as diagnosis to subsidies

### ★ Core Differentiators

1. Supervisor-Worker Agent Orchestration

Modular, scalable architecture

1.  

2. Contextual Synthesis (Cross-Talk)

3. Grounded Event-Driven trees

4.  Amalgamated RAG & Safety Guardrails  
Bedrock: Factual Accuracy & Privacy

1.  Auto-links insights (e.g., Pest → Subsidy)

3.  IOT triggers alerts BEFORE crop stress 

### Unique Value Proposition (UVP)

URE: A proactive, synthesized "Digital Village Companion" that anticipates needs and coordinates expert solutions.

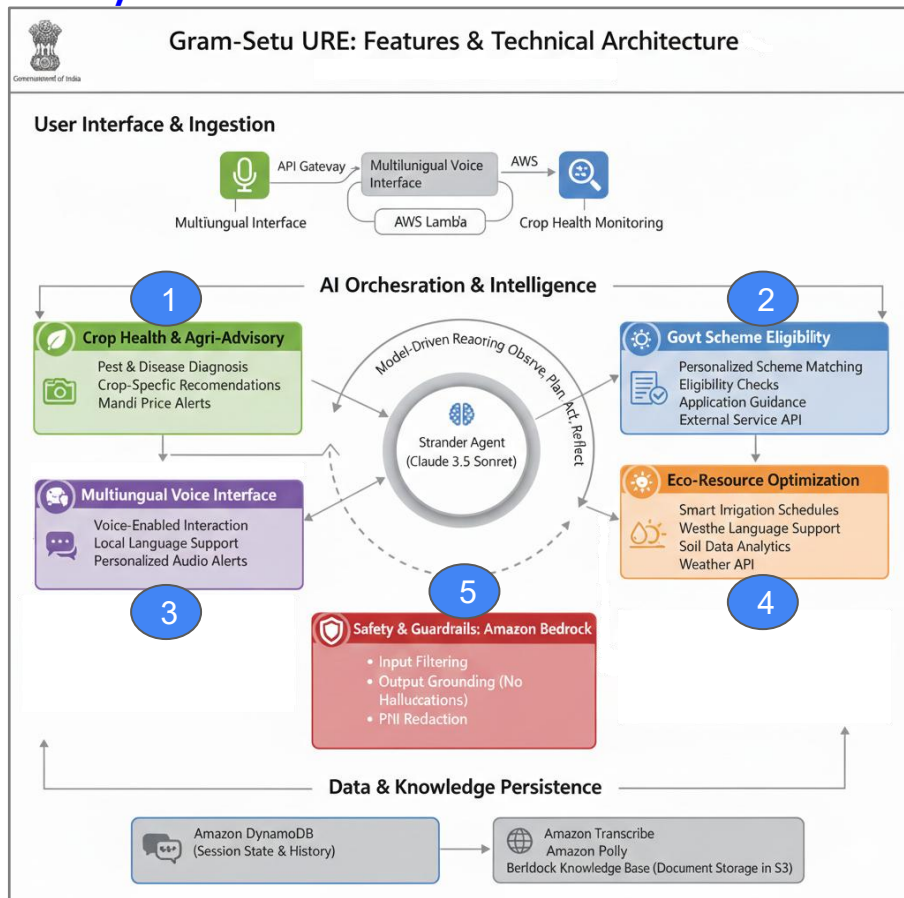

### Strategic Moats

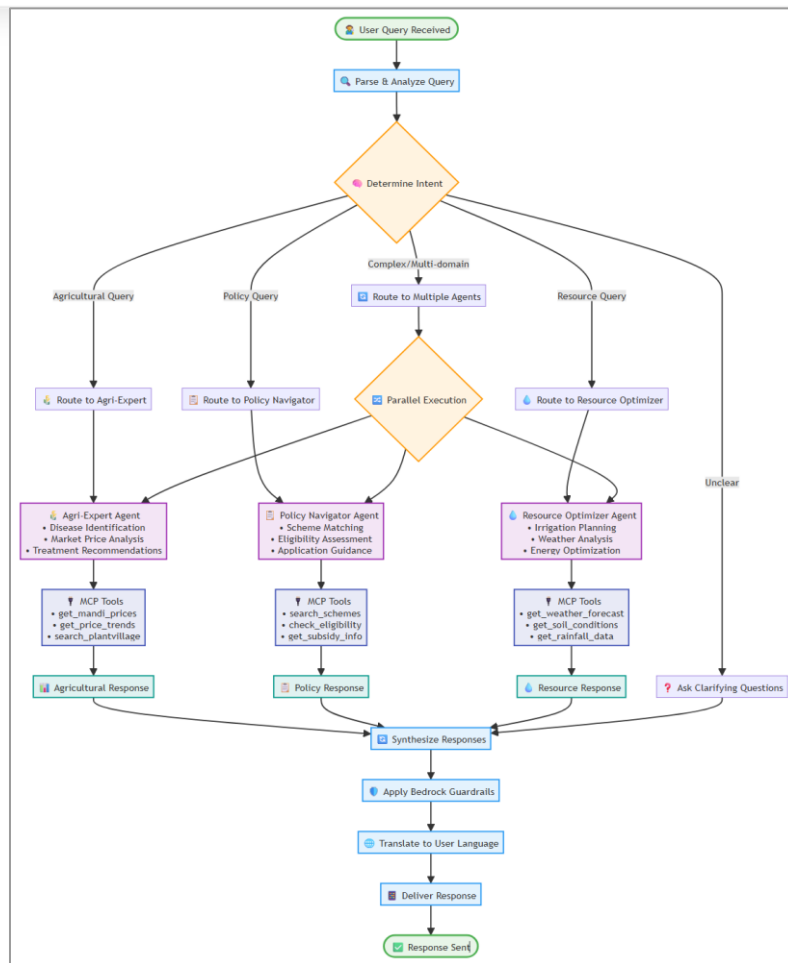

- Architectural Complexity
- Service-First Trust

 Voice-First Trust

Namaste! I am your Unified Rural Ecosystem assistant. You can send me a photo of your crop, ask about government schemes, or get irrigation advice. How can I help you today?

Agent output providing details of the uploaded images or text, action that needs to be taken for crop and market analysis along with the subsidy information

I found these yellow spots on my wheat leaves. What should I do?

[Image Uploaded: wheat\_leaf.jpg]

I've analyzed your request. Here is what our experts found:

### Agri-Expert Agent (Vision Analysis)

**Diagnosis:** Yellow Rust (*Puccinia striiformis*).

**Action:** Spray Propiconazole 25 EC @ 1ml/liter of water.

**Market:** Current wheat price in your local Mandi is ₹2,125/quintal.

### Policy-Navigator Agent (Scheme Check)

**Subsidy Alert:** You are eligible for a 50% subsidy on fungicides under the *National Food Security Mission (NFSM)*. Visit your local block office with your Aadhaar card.

Would you like me to help you apply for the subsidy?

## Architecture diagram of the proposed solution

# Technologies to be used in the solution

## 1. Core Intelligence Layer

- **Amazon Bedrock:** Hosts and manages foundation models securely at scale
- **Anthropic Claude 3.5 Sonnet:** Handles advanced reasoning and decision-making
- **Amazon Titan Embeddings:** Generates vector embeddings for semantic search

## 2. Orchestration & Agents Layer

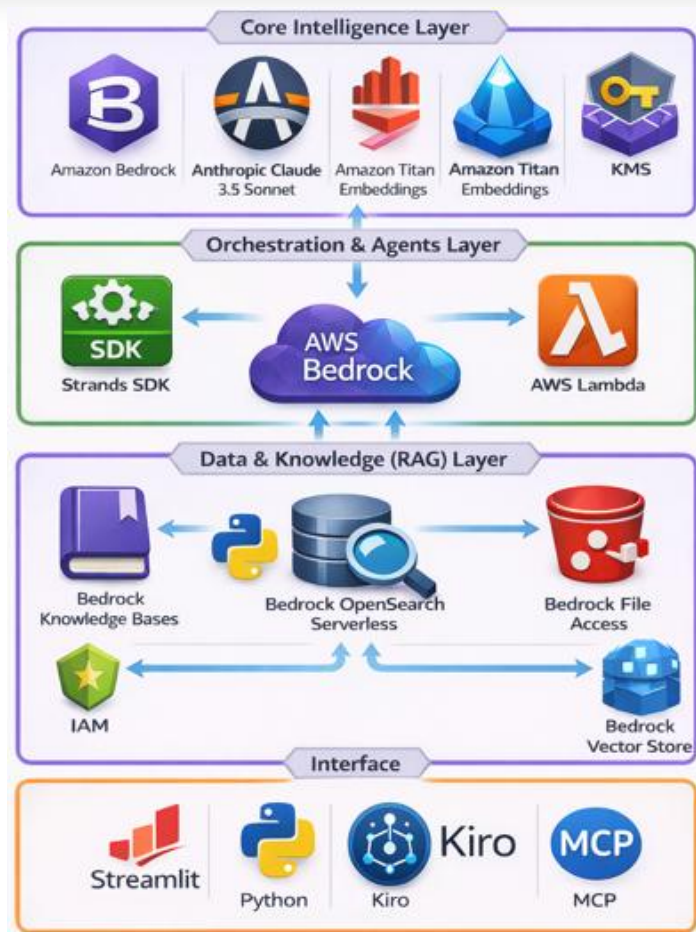

- **Strands Agents SDK:** An open-source framework used to build the Supervisor-Worker agentic architecture
- **AWS Lambda:** Provides serverless compute to execute logic and connect agents to external APIs

## 3. Data & Knowledge (RAG) Layer

- **Amazon Bedrock Knowledge Bases:** Manages the RAG pipeline to link agents to private data source
- **Amazon OpenSearch Serverless:** The vector database for low-latency retrieval of government schemes
- **Amazon S3:** Scalable object storage for the Plant Village dataset and user-uploaded images
- **Amazon DynamoDB:** Maintains session state and metadata.

## 4. Interface

- **Streamlit:** User-facing application interface
- **Python Runtime:** Core execution environment for agent workflows
- **Kiro Tool:** Supports agent monitoring and debugging
- **MCP:** Standardized "plug-and-play" interface between Agents

## Estimated implementation cost (1/2)

Layer	Service	Cost Model	Estimated Cost
Core Intelligence	Amazon Bedrock (Claude 3.5 Sonnet)	Pay-per-inference (tokens)	Moderate - High
Core Intelligence	Amazon Titan Embeddings	Pay-per-embedding	Low
Orchestration & Agents	Strands Agents SDK	Open-source	Free
Orchestration & Agents	AWS Lambda	Pay-per-invocation	Very Low
Data & Knowledge (RAG)	Bedrock Knowledge Bases	Usage-based	Low
Data & Knowledge (RAG)	Amazon Open Search Serverless	Storage + query-based	Moderate
Data & Knowledge (RAG)	Amazon S3	Pay-per-storage	Very Low
Data & Knowledge (RAG)	Amazon DynamoDB	On-demand reads/writes	Low
Interface	Streamlit	Open-source	Free
Interface	Python Runtime	Open-source	Free
Interface	Kiro Tool	Tooling / Dev support	Minimal
Model Context Protocol	Secure & Seamless connection	Open-source	Free

**Notes :**

1. Total cost is directly proportional to the number of users. 2. Depending on LLM selected cost can be further optimized

## Estimated implementation cost (2/2)

### Cost Analysis & Optimization

Live financial simulator for the Gram-Setu Multi-Agent Ecosystem (Hackathon Preview)

Scale (Active Users) 600

#### OPTIMIZATION STRATEGY

**Prompt Caching**  
Up to 90% discount on repeated context—critical for conversation history.

**Batch Mode**  
50% discount for non-real-time tasks (e.g., daily report generation).

**Model Tiering**  
Use Claude 3.5 Haiku for simpler queries, reserving Sonnet for complex tasks.

**Routing Layer**  
Pre-classify queries to bypass Supervisor for FAQ-style questions, reducing agentic overhead.

#### STRATEGY IMPACT ANALYSIS

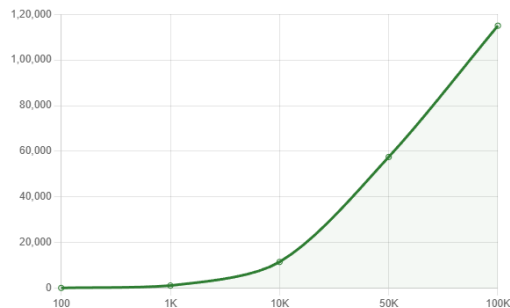

- **Efficiency Gain:** 0.0%
- **Opex Avoidance:** \$0/mo
- **Scale Readiness:** Growth Phase

EST. MONTHLY OPEX

**\$690**

UNIT COST / USER

**\$1.15**

### Cost Analysis & Optimization

Scale (Active Users) 600

#### OPTIMIZATION STRATEGY

**Prompt Caching**  
Up to 90% discount on repeated context—critical for conversation history.

**Batch Mode**  
50% discount for non-real-time tasks (e.g., daily report generation).

**Model Tiering**  
Use Claude 3.5 Haiku for simpler queries, reserving Sonnet for complex tasks.

**Routing Layer**  
Pre-classify queries to bypass Supervisor for FAQ-style questions, reducing agentic overhead.

#### STRATEGY IMPACT ANALYSIS

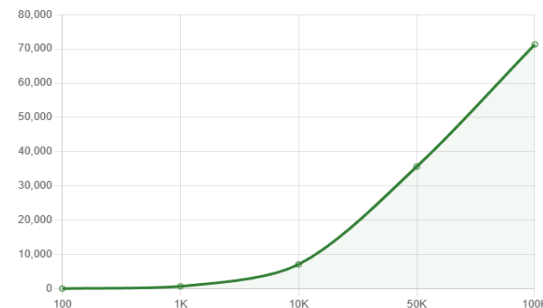

- **Efficiency Gain:** 38.0%
- **Opex Avoidance:** \$262.2/mo
- **Scale Readiness:** Growth Phase

EST. MONTHLY OPEX

**\$427.8**

UNIT COST / USER

**\$0.71**

### Monthly Cost Projections (ap-south-1)

#### Assumptions:

- 90 interactions/user/month (60% text, 20% image, 20% RAG)
- supervisor + specialist = 2 Bedrock calls minimum
- 1024 MB Lambda, 3s duration; HTTP API Gateway
- DynamoDB on-demand for user context persistence

### Strategy Definitions

- **Prompt Caching:** Reuses cached token IDs to bypass compute.
- **Batch Mode:** Leverages asynchronous processing for 50% API cost reduction.
- **Model Tiering:** Cost-optimal routing between Claude model variants.
- **Routing Layer:** Heuristic-based shortcutting to minimize LLM inference.
